

ITIS/ITCS 4180/5180 Mobile Application Development
In Class Assignment 12

Basic Instructions:

1. In every file submitted you **MUST** place the following comments:
 - a. Assignment #.
 - b. File Name.
 - c. Full name of all students in your group.
2. Each group should submit only one assignment. Only the group leader is supposed to submit the assignment on behalf of all the other group members.
3. Please download the support files provided with this assignment and use them when implementing your project.
4. Export your project as follows:
 - a. From eclipse, choose “*Export...*” from the File menu.
 - b. From the Export window, choose *General* then *File System*. Click *Next*.
 - c. Make sure that your project for this assignment is selected. Make sure that all of its subfolders are also selected.
 - d. Choose the location you want to save the exported project directory to. For example, your *Desktop* or *Documents* folder.
 - e. When exporting make sure you select *Create directory structure for files*.
 - f. Click Finish, and then go to the directory you exported the project to. Make sure the exported directory contains all necessary files, such as the .java and resource files.
5. Submission details:
 - a. Only a single group member is required to submit on moodle for each group.
 - b. The file name is very important and should follow the following format:
Group#_InClass12.zip
 - c. You should submit the assignment through Moodle: Submit the zip file.
6. **Failure to follow the above instructions will result in point deductions.**

In Class Assignment 12 (100 Points)

In this assignment you will get familiar with fragments and implement an app to add and display expenses. You will use Firebase to store and retrieve user expenses. The app consists of a single empty activity (MainActivity) and five fragments.

The image shows two wireframe designs for mobile app fragments. The left wireframe, titled 'Expenses App (Login)', features a dark header bar with a hamburger menu icon. Below the header, there are two text input fields labeled 'Email' and 'Password'. At the bottom, there are two buttons: 'Login' and 'Create New Account'. The right wireframe, titled 'Expenses App (SignUp)', also has a dark header bar with a hamburger menu icon. It contains three text input fields labeled 'Full Name', 'Email', and 'Password'. At the bottom, there are two buttons: 'Sign Up' and 'Cancel'.

(a) Login Fragment

(b) SignUp Fragment

Figure 1, Wireframe for Login and SignUp Activities

Part A: User Signup and Login (25 Points)

Your app should implement both login and signup functionalities. You should use Firebase to register a user with an email and password, and also store the user's full name, email address, and password in the User object:

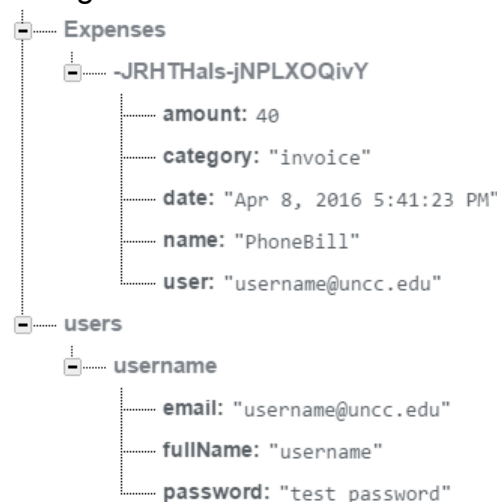

1. Please make sure to enable Email & Password Authentication under "Login & Auth" of your Firebase dashboard.
2. The launcher activity should be set to the Login Fragment. When the app first starts, the Login Fragment should check if there is a current user session, by using the Firebase provided methods to check if there is a valid current user:
 - a) If there is a current valid user, then start the Expenses List Fragment, and finish the Login Fragment.
 - b) If there is no current valid user, then the Login fragment should be loaded
3. Create a Login fragment (Figure 1(a)):
 - a) The user should provide their email and password. The provided credentials should be used to authenticate the user using Firebase. Clicking the "Login" button should submit the login information to Firebase to verify the user's credentials.
 - If the user is successfully logged in then start the Expenses List fragment, and finish the Login fragment.

- If the user is not successfully logged in, then show a toast message indicating that the login was not successful.
 - b) Clicking the “Create New Account” button should start the Signup fragment and finish the Login fragment.
4. Create a Signup fragment (Figure 1(b)):
- a) Clicking the “Cancel” button should finish the Signup fragment and start the Login fragment.
 - b) The user should provide their username, email and password. The provided credentials should be added as a registered user. Clicking the “Sign Up” button should submit the user’s information to Firebase to verify the user’s credentials.
 - If an account with the same email already exists, display an error message indicating that the account was not created and the user should select a different email.
 - If an account with the provided credentials does not already exist, then store the new account information and display a Toast indicating that the user has been created. Then start the Login fragment and finish the Signup fragment.
 - Note that, the user data should be stored in Firebase Users because the user authentication for registered users will not automatically store Username in Firebase.

Part B: Expenses List Fragment (35 Points)

The Expenses List fragment should retrieve the expenses for the currently logged in user that are stored in Firebase. A ListView should display the expenses names and amount of the expense of the retrieved expenses, see Figure 2a. The requirements are as follows:

1. You need to retrieve list expenses from the stored Expenses object in Firebase as shown in the below figure.

2. The Expenses should be retrieved belonging to the currently logged in user. Check the documentation provided at <https://www.firebase.com/docs/web/guide/retrieving-data.html>
3. Clicking an expense in the ListView should show the Expense Detail fragment.
4. Clicking the “Add Expense” menu item should show the Add Expense fragment. As shown in Figure 2(b), and should result in an added expense, as in 2(c).
5. Clicking on logout, see 2(h), should end the current user session and display the Login fragment.

Expenses List	
Electricity Bill	\$ 80
Bought Xbox one	\$ 350
Rent Paid	\$ 800
Chicago Trip	\$1000
Transportation	\$ 100
Grocery Bill	\$ 200
Movie Tickets	\$ 30

Chicago Trip	\$1000
Transportation	\$ 100
Grocery Bill	\$ 200
Movie Tickets	\$ 30
Phone Bill	\$ 60

Figure 2d, Logout

Part C: Add Expense Fragment (25 Points)

The Add Expense fragment should enable the currently logged-in user to create a new expense. The user should enter the expense name, category, amount and date, as show in Figure 3. The requirements are as follows:

1. Clicking the “Add Expense” button:
 - a) Should validate the user’s input and ensure that all the fields are provided.
 - If any field is missing, display a Toast to indicate the missing field.
 - If all the fields are provided, then save the new expense in the Expenses object in Firebase. If the Expenses object is not been created already please add a child to the root object as expenses and then add the created expense.
 - For every expense object, save the Expense name, category, amount, date and user email id who is creating the expense.
 - After successful saving to Firebase, the Add Expenses fragment should be finished. Upon returning to the Expenses List fragment the list should be updated to display the newly added expense.

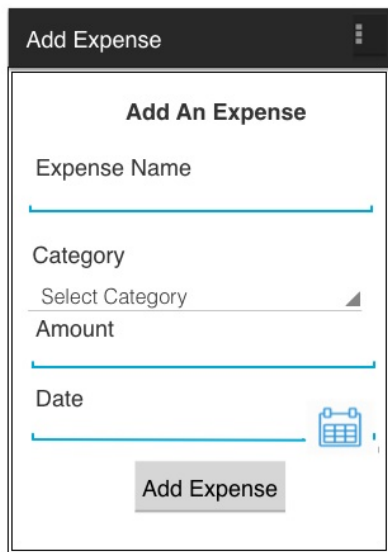

Figure 3, Add Expenses fragment

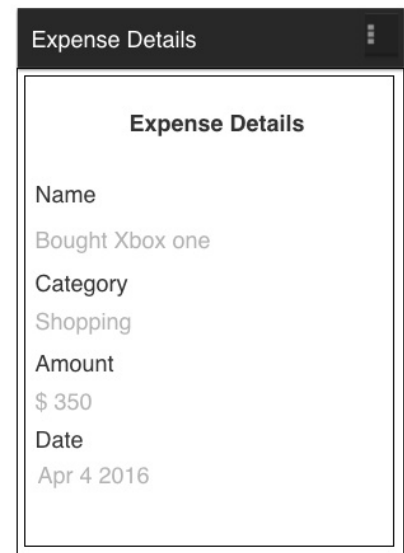

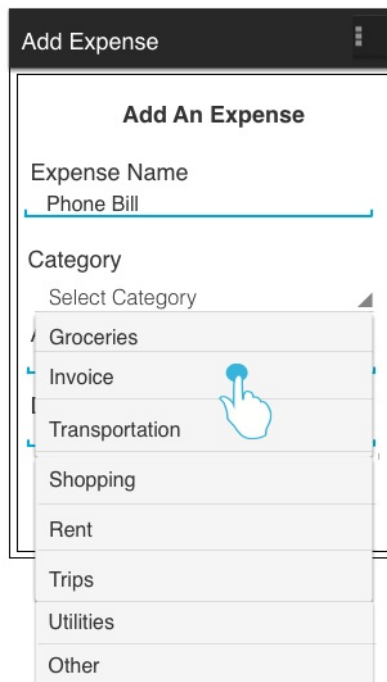

Figure 4, Expense Details Fragment

Part D: Expense Details Fragment (15 Points)

The Expense Details fragment shows the Expense details, which include the Expense name, category, amount and date, see Figure 4.

1. Clicking the back button should finish the Expense Details fragment and go back to the Expense List fragment.
